

IPv6 in Virtualized Data Centers

Christopher Werny, cwerny@ernw.de

Enno Rey, erey@ernw.de

Who We Are

- Network (IPv6) geeks, working for
- Germany based ERNW GmbH
 - Independent
 - Deep technical knowledge
 - Structured (assessment) approach
 - Business reasonable recommendations
 - We understand corporate
- Blog: www.insinuator.net

Motivation

- Increasingly customers are asking us whether they can use IPv6 within their virtualized environments.
- Mainly these questions center around:
 - Can we use IPv6 within the virtual machines?
 - What kind of security services can be implemented for IPv6?
 - E.g. *IPv6 First Hop Security* features in virtual switches.

Motivation

- Can we perform management operations of the virtual infrastructure over IPv6?
 - E.g. for an IPv6-only datacenter deployment.
- What kind of IPv6 support do these “new” network virtualization platforms have?
 - Microsoft HNV, VMware NSX etc.

Agenda

- This presentation is split into two parts.
- Part 1 is focusing on “traditional” hypervisors used for server virtualization and their respective virtual switches.
- Part 2 is focusing on network virtualization platforms.

Starting with Part 1...

“Traditional” Server Virtualization on several Hypervisor Platforms

Lab Setup

- Three different types of Hypervisors
 - Windows Server 2012 R2 Hyper-V 3.0
 - VMware vSphere 6.0
 - Kernel-based Virtual Machine (KVM)
- ... with three different types of virtual switches
 - Hyper-V vSwitch
 - Cisco Nexus 1000V
 - Open vSwitch

Lab Environment Overview

Microsoft Hyper-V 3.0

On Windows Server 2012 R2

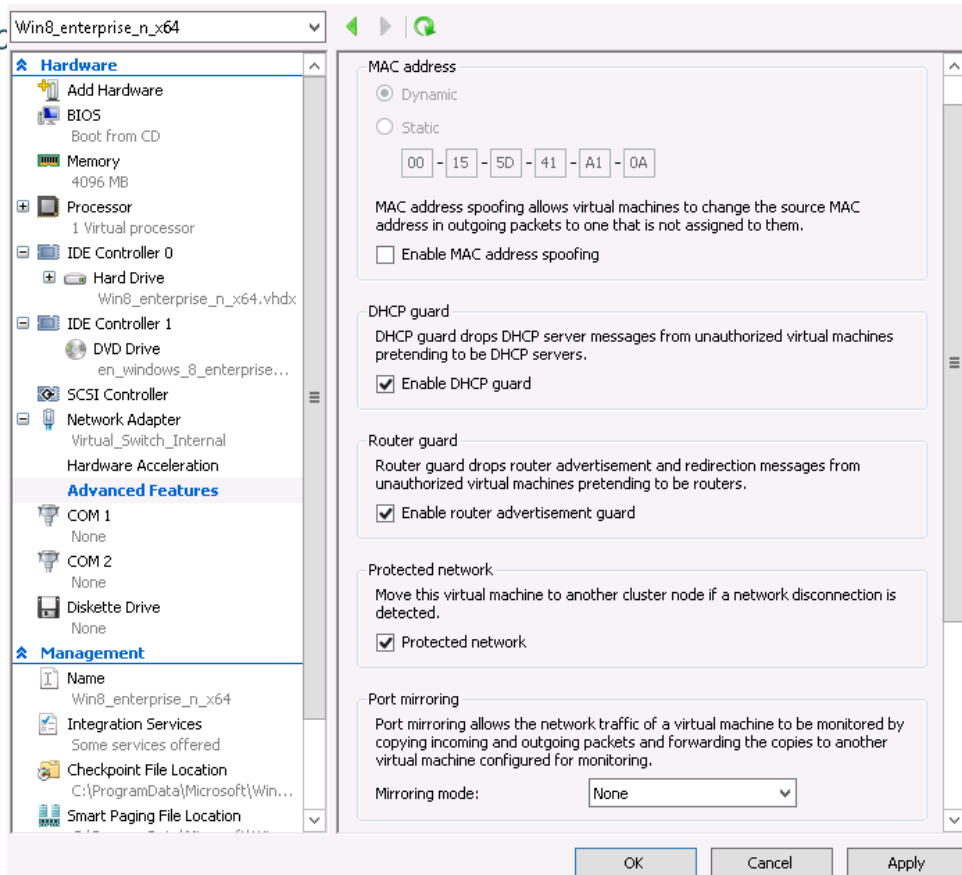

Management Capabilities

- Microsoft Hyper-V 3.0 has quite solid support of IPv6 for managing the hypervisor.
- Failover can be implemented over IPv6.
- Communication between the Virtual Machine Manager and the hypervisor can be realized over IPv6.

Hyper-V vSwitch FHS

- The Hyper-V vSwitch supports:
 - RA-Guard
 - DHCPv6 Guard
 - NDP Snooping capabilities
 - Extended/Stateful (IPv6) ACLs
 - Configurable via PowerShell.
- Details about the effectiveness of those features can be found in [1].

vSphere 6 with Nexus 1000v

Management Capabilities

- VMware made huge improvements in regards to IPv6 support for management functionality in the vSphere 6.0 release.
- Overall most of the features can be run over IPv6, but there are still some limitations:
 - vSphere Authentication Proxy works only over IPv4 [2].
 - Management interfaces used for HA must be configured with IPv4 _or_ IPv6. Running both in parallel is not supported [3].
 - Virtual SAN transport network is IPv4-only[4].

IPv6 Feature Capability Overview

Feature	vSphere 5.5	vSphere 6.0
PSC/SSO, Inventory Services	not supported	supported
Common Logging Infrastructure	not supported	supported
vCenter Converter	not supported	supported
vMotion	Supported	supported
vCLI	not supported	supported
vAPI	not supported	supported
Host Profiles	not supported	supported
vSphere Management Assistant	not supported	supported
vSphere Update Manager	not supported	supported

Nexus 1000v IPv6 FHS

- Unfortunately, no IPv6 FHS features available on the Nexus 1000v.
- The only option you have is using port based ACLs for filtering IPv6 traffic
 - IPv6 ACLs were introduced in 5.2(1)SV3(1.1).
- Will be coming "soon".

KVM with Open vSwitch

KVM & Open vSwitch

- ▢ Ubuntu 14.04.2 LTS
 - 3.13.0-32-generic
- ▢ QEMU
 - Version 2.0.0
- ▢ OpenFlow
 - 1.4
- ▢ Open vSwitch
 - 2.3.1

Management Capabilities

- The management capabilities heavily depend on the specific management platform used for KVM.
 - E.g. in Cloudstack environments the KVM agent can only communicate over IPv6 with the management server beginning in 4.5.0 [5].

Open vSwitch FHS

- Unfortunately, no IPv6 FHS features available.
- Only IPv6 ACL based behavior based on flow entries matching could be configured.
 - E.g. to block malicious RAs.

Interim Conclusion

- IPv6 support for the management plane gets closer to IPv4.
- IPv6 security capabilities are slowly increasing in virtual switches but it is still a long way to go until we have (IPv6 security) feature parity with the physical world.

Continuing with Part 2...

Network Virtualization Platforms

Hyper-V Network Virtualization

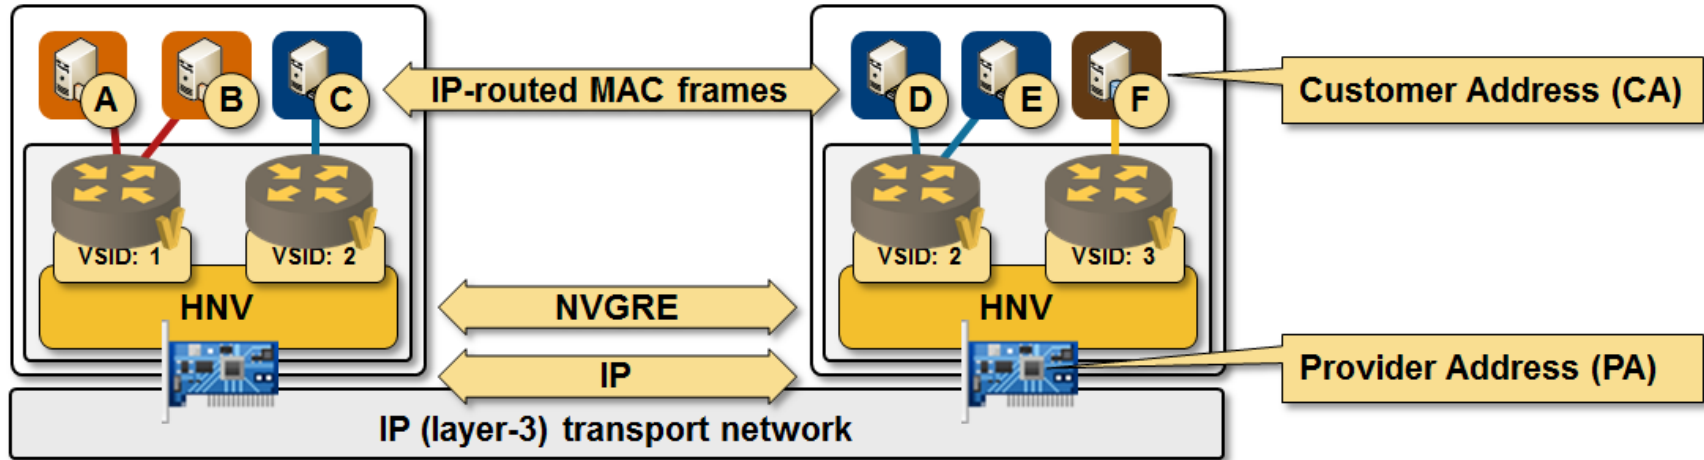

On Windows Server 2012 R2

Hyper-V Network Virtualization

- Part of Microsoft's SDN strategy.
- Provides the possibility to present virtualized network architectures to virtual machines.
- Abstracted from the underlying physical network infrastructure.
- Every virtualized network is isolated from each other and can only communicate over a dedicated virtual gateway (if desired).

Hyper-V Network Virtualization

- Picture kindly borrowed from Ivan Pepelnjaks (@dioshints) [IPv6 Microsegmentation](#) presentation at the [IPv6 Security Summit](#)

IPv6 Capabilities

- HNV has extensive IPv6 support for management and tenant networks and provides nearly full feature parity between IPv4 and IPv6.
- This include management as well as using IPv6 as a transport protocol for the NVGRE tunnels.
- The only restriction is that a VM Network created with HNV can either be IPv4 or IPv6 enabled. Using both protocols in the same VM Network is currently not supported[6].
 - A VM could still use *dual stack*, but then each stack has to be member of a different VM Network.

VMware NSX for vSphere Hypervisor 6.x

VMware NSX for vSphere

- Overlay Virtual Networking Solution
 - Provides logical Layer-2 and Layer-3 segments
 - Distributed VM-NIC firewalls
 - Network services (VPN Gateway, NAT, Load balancers)
- Abstracted from the underlying physical network infrastructure.
- Similar to HNV but uses VXLAN encapsulation.

IPv6 Capabilities

- As with vSphere 6.0, VMware made huge improvements in regards to IPv6 support in NSX 6.x but there are still some limitations:
 - VMware NSX Edge Router does not support dynamic routing protocols for IPv6 (e.g. OSPFv3).
 - VMware NSX Distributed Router does not support IPv6.
 - A complete list of limitations can be found in [7].

Summary

Management & control plane (over IPv6) capabilities are getting better and it shouldn't take that long until we have full feature parity.

IPv6 security features on virtual switches are still behind in comparison with the physical world

- Microsoft's Hyper-V virtual switch currently provides the best support of FHS features.

Even though network virtualization platforms are a quite new technology, the overall IPv6 support for management and tenant networks is pretty good, with small limitations on different platforms.

There's never enough time...
